KAPPA

KAPPA night

KAPPA is an aluminum profile system made of component parts that can be used to create interior design solutions for residential, working and commercial spaces.

For walk-in closets, the vertical posts, with minimalist design, sustain shelves, coat-hanger tubes, draws and cabinets with a rack system.

The telescopic small legs with very precise regulators, allows an exact levelling of the posts further, a screw grain allows for a height regulation of the rack, consequently of the shelves. The posts may be fixed to the walls or to the ceilings.

The KAPPA system placed in wardrobes allows the substitution of the wooden back panels of 22 mm with aluminum frames. therefore, when the doors of wardrobe are open it looks like a walk-in closet, with no space between the compartments. The aluminum frames may be tailor made as they are assembled with zama joints, with no work what so ever on the profiles leaf, folding or sliding doors are possible.

Hinges can be mounted on the interior profile with mounting plate of 28 mm and the classical shelf shoulders or in alternative a rack can be placed on the back. The posterior profile fits a wooden or glass back (with seals). The cross profile is made ready to screw ties for the eccentric fixing of the tops and the bases of the wardrobes.

The small vertical posts (22 x 38 mm) placed against the wall sustains thanks to the rack, shelves, cabinets, coat-hanger tubes etc. A plastic coextruded profile hides the presence of the rack

Placed on the back, the same small profile can be put on the back for wardrobe with one piece base and tops. It is sufficient to prepare both on the top and on the base a constant spaced out punch e.g. of 15 cm, and then compose the interior of the wardrobe at will alternating module of 30, 45, 60 and 90 cm.

It is possible to design libraries or self supporting sideboards of light and minimal design an aluminum frame substitutes the wooden shoulders creating a slim structure in which vertical crossbars sustain shelves and containers.

The walls of the living space may be equipped with libraries and suspended mobile containers the small profile fixed to the wall sustains shelves and removable cabinets leaving freedom of design.

In small bedroom it is possible to predispose a paneling among the wall vertical profiles, so obtaining boiserie equipped with hidden racks. A unique hook system makes it possible to remove the panelling in any given moment to allow inspection.

Fixing KAPPA between floor and ceiling does allow for libraries and glass shelves. The shelf supports are hooked to the rack hidden behind the vertical posts.

With KAPPA is possible to furnish commercial spaces with different kinds of exhibitors. The aluminum profiles placed between floor and ceiling or between floor and wall constitutes a minimalist and light interior design solution. In this specific case the vertical profile can be placed in the center of the width of the shelf.

Aluminum frames tailor made enable the design of self supporting exhibitors that are easy to relocate. It is possible to modulate equipped walls in which the rack have wood, glass, mirror etc. can all be used with the small profile. A swift relocation of the furnishing in the different spaces is made possible due to the easy disassembly system of the rack.
